1. Define Tableau.

Tableau is a strong tool for showing data in a simple way. It helps connect to many types of data and lets users make interactive dashboards and reports. It's famous for being the best tool in Business Intelligence (BI) for showing data visually. Tableau is good at changing raw data into easy-to-understand forms. It works fast, which makes analyzing data quicker. With Tableau, making visualizations like dashboards or diagrams helps everyone in a company understand complex information without much effort.

2. Explain Data Blending in Tableau.

- Data blending within Tableau involves combining data from various sources into a single visualization or workbook. It enables users to merge data from diverse databases, files, or connections to glean deeper insights or craft more exhaustive analyses.
- Data blending proves particularly advantageous when users necessitate combining data from disparate sources that cannot be readily joined in a single database query. It facilitates more adaptable analysis and visualization of intricate datasets.

3. What are parameters in Tableau?

- In Tableau, parameters serve as dynamic values that empower users to manipulate aspects of their visualizations without altering the underlying data. Acting as placeholders for specific values, parameters enable interactive adjustments within Tableau's interface.

- Overall, parameters within Tableau amplify the flexibility and interactivity of visualizations, empowering users to delve into data exploration and analysis with enhanced effectiveness.

4. What is the process for publishing a workbook to Tableau Server?
