## Front End Technologies in Dot Net Full Stack Development

Creating and managing applications constructed with the .NET framework is the responsibility of a full stack .NET developer.

- They should be well-versed in the front-end and back-end aspects of application development.
- They need to be proficient in HTML, CSS, and JavaScript front-end design and implementation of user interfaces.
- Their ability to work with databases, online services, and server-side resources must extend to the back end.

### HTML, CSS, Bootstrap, and JavaScript

Working as a .NET full stack developer requires a strong foundation in front-end programming concepts. Because they enable the creation of aesthetically stunning user interfaces, HTML, CSS, and JavaScript are the fundamental technologies of web development.

**HTML stands for Hypertext Markup Language**, and it establishes the foundation for creating web documents by defining the format and content of web pages.

**CSS (Cascading Style Sheets):** CSS controls how web pages appear visually, enabling developers to add styles, modify elements, and guarantee a uniform look across platforms.

**JavaScript:** JavaScript is a powerful programming language that adds interactivity to websites by enabling additional features such as event handling, dynamic behavior, and DOM manipulation.

*Programming languages such as JavaScript are widely used in front-end, back-end, and*

## **Layout design using C#.Net, WCF, WPF, ASP.Net, ADO.Net, and SQL Server.**

The placement of visual components on a grid to express a certain idea is referred to as layout. No matter how good a design looks, it is useless if the layout is hard to understand.

A layout design, which can also enhance performance by ensuring a fluid message flow, can specify the overall appearance and the connections between graphic elements.

- Layout Design
  - Text
  - Images
  - Lines
  - Shapes
  - White Space
- Hierarchy
- Balance
- Alignment
- Proximity

### **Importance of Layout Design**

The following are a few of the most evident advantages of having a fantastic layout design:

- Make a lovely harmony with the fonts, colors, backgrounds, and other elements.
- Facilitating the material flow will make it easier

## **C#.Net**

C# may be used to construct a wide range of programs and applications, including games, cloud-based services, mobile and desktop apps, websites, enterprise software, and cloud-based apps. C# is most typically employed in three areas:

### **Windows Applications**

Developing apps and programs that are tailored to the Microsoft platform's architecture is the finest use case for C# because these applications depend on the Windows Dot Net framework to perform at their best.

Since Microsoft developed C# for Microsoft, it makes sense that the majority of apps developed with it are Windows desktop programs.

### **C# for Games**

One of the greatest programming languages for games may be C#. Popular games like Rimworld using the Unity Game Engine are made a lot with this language.

- Unity is the most widely used game engine out there. Over one-third of the best and most played games in the business were created using Unity.
- Because of cross-platform technologies like Xamarin, C# can be utilized on almost any modern mobile device or console and integrates flawlessly with the Unity engine.

### **C# for website development**

C# is frequently used to create open-source

software and polished, dynamic websites on the .NET framework.

You can still utilize C# to develop a completely functional website with Microsoft architecture.

Because of its object-oriented architecture, this language is well-liked for building incredibly efficient, easily scalable, and stable websites.

#### **WCF: Windows Communication Foundation**

Application developers utilize the WCF architecture to develop service-oriented apps. With WCF, data can be sent asynchronously between service endpoints in the form of messages.

A service endpoint might be part of an IIS-hosted continuously accessible service or one that is hosted by an application.

#### **Benefits of WCF**

- A safe platform for handling financial transactions.
- A service, such as a traffic report or other monitoring service, that provides others with up-to-date information.
- A real-time data sharing or communication tool for two people via chat.
- A dashboard application that gathers data by polling one or more services and displays it logically.
- Exposing as a WCF service a workflow that was built with Windows Workflow Foundation.

#### **WPF: Windows Presentation Foundation**

A free and open-source user interface framework for desktop Windows apps is called WPF. WPF apps are typically created with C# and XAML and are built on the .NET framework.

- WPF is a framework for creating sophisticated Windows client applications.
- It offers a standardized programming paradigm for creating graphical user

interfaces for desktop applications.

- WPF separates UI design from logic by using XAML (eXtensible Application Markup Language) to specify the user interface's layout and appearance.
- WPF programs can construct interactive and aesthetically pleasing user interfaces by utilizing advanced features like data binding, styling, templating, animation, and multimedia support.
- WPF is commonly utilized in the development of stand-alone desktop programs that execute on Windows and fully utilize the Windows operating system.

### **ASP.Net**

ASP.NET is a free online framework that uses HTML, CSS, and JavaScript to create amazing websites and web applications. Additionally, real-time technologies like Web sockets and Web APIs can be created. One substitute for ASP.NET is ASP.NET Core.

ASP.NET enhances the .NET platform in the following ways:

#### **Basic C# or F# framework for Web Applications**

```
<html>

<body>

    <h1>Hello Web Pages</h1>

    <p>The time is @DateTime.Now</p>

</body>

</html>
```

A simple method for combining HTML, CSS, and server code is through web pages:

- Simple to use, comprehend, and learn
- It employs the Single Page Application (SPA) application architecture.
- Comparable to the scripting languages PHP and Classic ASP, VB (Visual Basic), and C# (C sharp)

## Razor is a web page templating vocabulary used in C# to create dynamic web pages.

A straightforward markup syntax called Razor is used to incorporate server code (C# or VB) into ASP.NET web pages.

```
<!DOCTYPE html>
```

```
<html lang="en">
```

```
<head>
```

```
    <meta charset="utf-8" />
```

```
    <title>Web Pages Demo</title>
```

```
</head>
```

```
<body>
```

```
    <h1>Hello Web Pages</h1>
```

```
    <p>The time is @DateTime.Now</p>
```

```
</body>
```

```
</html>
```

### Razor Syntax for C#

- Code blocks in C# are delimited with @{... }.
- Variables and functions that are inline expressions begin with @
- A semicolon is used to conclude code statements.
- The datatype (int, string, etc.) or the var keyword is used to declare variables.
- Quotation marks are used to surround strings.
- Case matters in C# code
- The file extension for C# files is '.cshtml.'

A database, libraries, and template pages are all part of this authentication system, which can handle logins and support multi-factor authentication as well as external authentication through Google, X, and other services.

Extensions for editors that offer code completion, syntax highlighting, and other features tailored to web page development.

### ADO.Net

Consistent access to data sources like OLE DB and

ODBC, as well as data sources like SQL Server and XML, is made possible via ADO.NET.

Consumer data-sharing apps can use ADO.NET to connect to several data sources and retrieve, control, and update the data they hold.

#### **ADO.Net Components**

The DataSet and .NET Framework data providers are the two primary ADO.NET components for data access and manipulation.

- The components known as the .NET Framework Data Providers were created specifically to manipulate data and provide quick, read-only, forward-only access to it.
- Data access from any data source is explicitly intended for the ADO.NET DataSet.

#### **SQL Server for Dot Net Full Stack Development**

A strong database management solution called SQL Server is frequently used with .NET applications. To properly query and handle data, a full stack .NET developer has to have a solid working knowledge of SQL Server.

#### **Features of SQL Server**

Here are the features and functionalities of Microsoft SQL Server:

- Database Management and Data Storage
  - Creating and managing databases is easy.
  - Wide range of data types and storage options.
- Security and User Management
  - Implementing security measures.
  - Managing user access and permissions.

## **Understanding the MVC Framework for Dot Net Development**

MVC features are combined to create a dot net framework. MVC is a design pattern that helps accomplish the separation of responsibilities in the design of data, application logic, and user interfaces.

Applications are divided into three component groups using MVC: Model, View, and Controller.

#### **Benefits of MVC for ASP.NET**

**Flexibility:** HTML needs to be extremely flexible to manage the evolution of user interfaces and usability in various business domains. The front-end components need to be changeable at all times.

**Test-Driven Development:** Testing is a key component of ASP.Net MVC development. By simplifying testing, it guarantees the project's development will be of the highest caliber.

**Easily integrates with other technologies:** It is possible to easily combine technologies like jQuery, JSON, and AngularJS with ASP.Net MVC and provide mobile functionality.

#### **Example for Models and Data**

Model classes can be created simply, and they can be bound to your database. Validation rules are defined declaratively and applied to both the client and the server using C# attributes.

```
public class Person
{
    public int PersonId { get; set; }

    [Required]
    [MinLength(2)]
    public string Name { get; set; }

    [Phone]
    public string PhoneNumber { get; set; }

    [EmailAddress]
    public string Email { get; set; }
```

```
}
```

### Example for Controllers

Requests are simply routed to controller actions, which are implemented as standard C# methods. Method arguments automatically bind data from the request body, query string, and request path.

```
public class PeopleController : Controller
{
    private readonly AddressBookContext _context;

    public PeopleController(AddressBookContext context)
    {
        _context = context;
    }

    // GET: /people
    public async Task Index()
    {
        return View(await _context.People.ToListAsync());
    }

    // GET: /people/details/5
    public async Task Details(int id)
    {
        var person = await _context.People.Find(id);

        if (person == null)
        {
            return NotFound();
        }

        return View(person);
    }
}
```

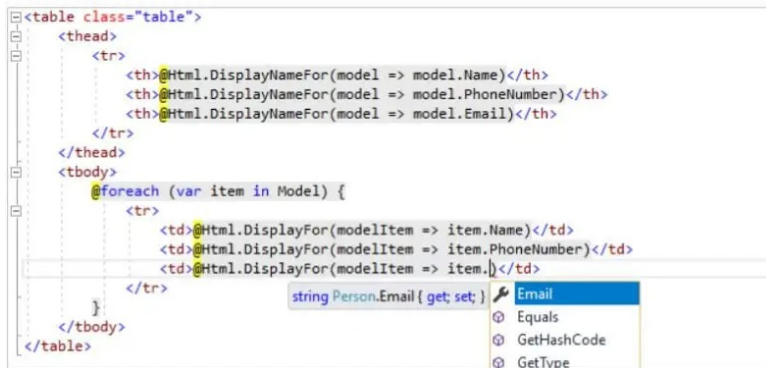

### Views with Razor

Rendering HTML text based on your view is made easy, clear, and lightweight with the Razor syntax.

You may create completely HTML5-compatible web pages with Razor by rendering a page in C#.
